

Anodized Aluminium.: A new revolution in the World of Lighting Industry.

It is worthwhile mentioning here that the best Control Gear, Lamp and Brand don't guarantee you the efficient lighting installation.

If the Aluminium optics is not treated, a simple installation would demand 10-15% more fixtures in six months time in order to maintain the pre-defined lux level.

Please note that the reflectivity of the untreated aluminium optics tends to reduce by more than 10% within six months of its installation.

Therefore the most important thing here is that **ALUMINIUM SHOULD BE ANODIZED** to maintain the reflectivity.

Not only in specifications but in reality as well!

We are looking forward to receive your queries with great interest.

Question à *How to find that aluminium is anodized or not?*

Please bear with us till our next circular.
